

Current Year Monthly Returns¹

	JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC	YTD	NAV
2023													-2.18%	98.11

Investment Objective and Strategy

The fund targets an absolute return by employing an equity market neutral strategy. The fund invests in Euro-denominated large cap stocks, part of the Stoxx600 index, on an equally-weighted basis, selected with the aim to reduce the portfolio volatility and correlation. The market risk is hedged with equity index futures.

Management Commentary

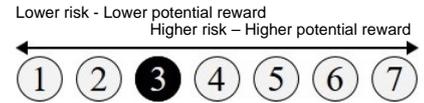

The sub-fund's result for the month, for class I, is negative by 2.18% due both to the slight negative beta (-7.11 on average) and to stock selection. The average beta of the stocks in the portfolio fell to values just over 40% due to the market's focus on very high beta stocks such as stocks in the financial sector. In detail, stock selection contributed by -1.44% and the portfolio's beta by -0.72% due to the sharp rise in the Euro Stoxx50 index (+10.13%).

From the sectoral analysis, we note that of the sectors in which we invest, only Communication Services outperformed the market by 8.07%, weighted by relative beta. Materials even had a negative performance of 4.10%. Fortunately, the allocation to this sector is less than 5%.

Among the individual stocks, we note an excellent performance by Cellnex (+16.04%) and du Fresenius Medical (+12.50%) with negative performances by Biomerieux (-4.66%) and Symrise (-4.10%).

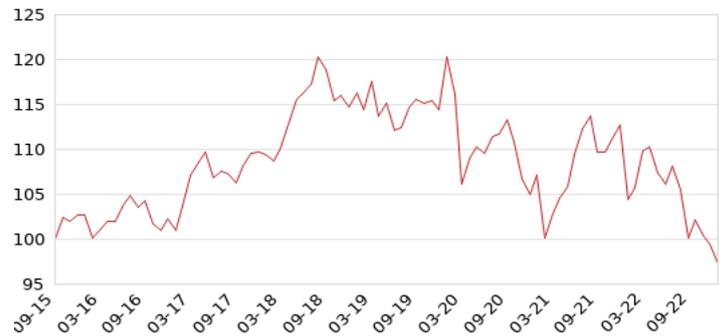

The expectations are for a reduction in consumers demand due to the increase in consumer prices and the related negative effect on share prices and consequently we will maintain the current allocation.

VAR (Value at risk) is a statistic indicator that measures and quantifies the level of financial risk of a portfolio of asset over a specific time frame and with a certain statistical level of confidence. In our case we report the risk associated with the sub-fund calculated with a 99% probability, over a period of 22 working days based on 3 years of data observation.

Sharpe ratio is a ratio developed by Nobel laureate William F. Sharpe to measure risk-adjusted performance. The Sharpe ratio is calculated by subtracting the risk-free rate from the rate of return for a portfolio and dividing the result by the standard deviation of the portfolio returns over an historical period. We use monthly returns over the last 3 years. The calculation reported is done on the performances of the Class I.

Modified Duration is the percentage price change of a security for a given change in yield. The higher the modified duration of a security, the higher its sensitivity to changes in yield (there is an opposite relationship between the price of a bond and its yield).

Beta (or Historical Beta) is obtained from the linear regression of historical data and is based on the weekly observed relationship between the sub-fund return and the returns of the Euro Stoxx50 index over the two years previous to the reference date.

Volatility is calculated on daily data.

Disclaimer.

Before investing in this fund, you should carefully read the Key Investor Information Document (the "KIID") and the prospectus.

The KIID, in Italian and English, the prospectus, the audited annual report and unaudited semi-annual report, in English, are available upon request to Pure Capital S.A. (hereafter "Pure Capital") (tel: +352 26 39 86) or on its website www.alessia.lu
